19 ABSTRACT (Continue on reverse if necessary and identify by block number)

This thesis focuses on Navy Transportation Time performance from ship ate to receipt date. The object is to compare data from a sample of non- echanized ships with summary statistics from the Requisition Response Time anagement Information System. The research effort is directed toward dentifying statistical differences between the two sources of data. The nalysis concentrates on fice major data groups: Transportation Time by onsignee, deployment status, modes of shipment, issuing stock point, and ssue Priority Group. The conclusion notes significant differences in ransportation Time performance among the groups.

ABSTRACT

This thesis focuses on Navy Transportation Time performance from ship date to receipt date. The object is to compare data from a sample of non-mechanized ships with summary statistics from the Requisition Response Time Management Information System. The research effort is directed toward identifying statistical differences between the two sources of data. The analysis concentrates on five major data groups: Transportation Time by consignee, deployment status, modes of shipment, issuing stock point, and Issue Priority Group. The conclusion notes significant differences in Transportation Time performance among the groups.

I. INTRODUCTION

A. BACKGROUND AND OBJECTIVES

Transportation Time is a measure of supply system performance. The Navy measures Transportation Time from the date material is shipped from a stock point until it is received by a supply customer. The framework for Transportation Time determination within the Defense Transportation System and the military services is governed by the Defense Logistics Standards System which provides common communication, policy, and procedures for users of defense logistics information.

Part of this system is the Uniform Material Movement and Issue Priority System (UMMIPS) which prescribes standards for Transportation Time for all requisitioners and processors of Department of Defense cargo. Transportation Time performance is measured against these standards in order to evaluate supply system effectiveness in support of national defense. Research on methods of measurement and evaluation of performance assists defense logistics managers in contingency planning, problem identification, and system improvement.

The Navy currently uses the Requisition Response Time Management Information System (RRTMIS) to collect, analyze, and report transportation information. A true picture of

Navy UMMIPS compliance is not being obtained because receipt data for the computation of Transportation Time is incomplete. Specifically, data from over 400 non-mechanized ships are not included in the RRTMIS data base.

This thesis concerns the results of an analysis of data obtained by a survey of non-mechanized ships. Of particular concern is how the survey data compare with similar RRTMIS data.

B. SCOPE, LIMITATIONS, AND ASSUMPTIONS

The scope of the research focuses on comparison of the RRTMIS and fleet sample means, analysis of variance among subgroups of both data sources, and multiple comparisons to determine specifically which groups were statistically different from others. Subgroups analyzed include service consignee, deployment status, modes of shipment, issuing stock point, and Issue Priority Group. Inferences and conclusions are drawn from facts resulting from the analysis.

Research concerning the interdependency of Transportation Time performance, Total Requisition Time, and the subgroup variables is beyond the scope of this study due to time constraints. The data have been made available in appendices to this thesis to facilitate further research.

The research is also constrained by circumstances surrounding the fleet survey. The professionalism of shipboard supply officers and their staff is relied upon in

providing accurate and unbiased survey responses. The mobile and out of reach aspect of deployed ships and submarines is of concern in obtaining adequate survey response rates. These constraints are considered to have made no significant effect on the outcome of the research, however.

Several important assumptions are made in the analysis. It is assumed that the source data in the survey responses is valid. In other words, if the mode of shipment reported for a requisition was Mode "9" it is assumed that that mode was,in fact, used in moving the material to its consignee.

It is assumed that if a survey indicates the ship was deployed that it was deployed for the entire period being considered. Similarly, if a ship indicates it was undergoing Integrated Logistics Overhaul it is assumed that it spent the entire period in that status.

It is also assumed that the surveyed fleet sample is representative of the population of non-mechanized ships in the Navy, and that the RRTMIS Transportation Time Report statistics are accurate.

Important statistical assumptions germane to this study such as the Central Limit Theorem and the equality of variances of data in the different groups are discussed in the Chapter V analyses.

C. SUMMARY OF FINDINGS

This thesis makes three major findings. First, significant differences among the RRTMIS and fleet sample

means exist in the service, deployment, mode of shipment, stock point, and overall priority groups. The RRTMIS statistics do not generally describe the sample data well.

Second, mechanized customers tracked by RRTMIS experienced longer mean transportation times than those for shipment to the fleet sample ships. Specific differences for each data group are presented in Chapters V and VI.

Third, ships in the fleet sample generally received a higher percentage of shipments on time relative to the UMMIPS time standards. An exception is that surface modes of shipment exhibited higher percentages of shipments on time in the RRTMIS data than in the data from the fleet sample.

D. ORGANIZATION

This thesis is divided into an introduction, two background chapters, two chapters of research and analysis, and a final chapter of conclusions. The two background chapters are organized to be read from the general to the specific. Chapter II provides an overview of the Department of Defense supply and transportation systems and introduces the reader to four major components of the Defense Logistics Standard System. Emphasis is placed on UMMIPS and Navy relationships. Chapter III explains the current framework for collecting and evaluating transportation measurement data. Interfaces between Defense and Navy data bases are

discussed, leading to a summary of RRTMIS issues relating to Transportation Time.

Chapter IV describes how the fleet survey was conducted and summarizes the responses. A discussion of the approach to the data is provided, along with a rationale for the methods that were used. Chapter V subjects the data to the statistical methods and analyzes the results in terms of the five variables previously mentioned. Chapter VI briefly summarizes conclusions reached in the analyses.

Four appendices are also included. Appendix A provides a glossary of Navy logistics acronyms and terms used throughout the study. Appendix B is the RRTMIS report used for the group comparisons in Ch. V. Appendix C is a list of the non-mechanized ships which were surveyed. Those ships which responded are marked with an asterisk (*). The tabulated data from the survey comprise the fleet sample provided in Appendix D.

II. BACKGROUND

A. THE DEFENSE SUPPLY SYSTEM

Each of the military Services has traditionally been responsible for its own logistics support. Over the years duplication has arisen in routine and common supply activities among the services. Recognizing this fact, the Department of Defense (DOD) has centralized many of these functions through various organizations and agreements. The Secretary of Defense, the Joint Chiefs of Staff, and the military Services control the management and operation of these functions.

The largest DOD supply organization is the Defense Logistics Agency (DLA). Its mission is to provide effective logistic support in the areas of contracting, supply contract administration, and technical services to all the military Services, and to Federal civilian agencies and foreign governments as assigned, and to provide that support at the lowest feasible cost to the taxpayer [1:106]. The DLA's activities are coordinated with the Joint Chiefs of Staff and controlled by the Assistant Secretary of Defense (MI&L). The agency is responsible for about two million items used by the military Services and other agencies. The DLA primarily manages consumable supply items such as food, clothing, medical and general supplies and spare parts.

These items are warehoused and distributed through six DLA supply centers and six supply depots.

The DLA and other DOD organizations work closely with the Services on supply matters. The Services' leading material management organizations are depicted in Figure II-1. (It is interesting to note that the Navy has recently restructured its logistics organization in an effort to streamline its acquisition process. The Navy Material Command (NAVMAT) which includes 70 percent of the Navy's civilian personnel and obligates 64 percent of the budget was disestablished in May 1985 [1:122]. The NAVMAT activities were redistributed within the various systems commands which now report directly to the Chief of Naval Operations.) Supply traditionally includes consumables, equipment, repair parts, storage, and services of maintenance, preservation, packing, distribution, and transportation.

Efforts to create a consolidated defense transportation agency have repeatedly failed because the Services resist giving up control of their respective systems. Instead, a transportation triumvirate has evolved to meet the dynamic needs of the Services: The Defense Transportation System.

B. THE DEFENSE TRANSPORTATION SYSTEM

Transportation requirements throughout DOD are provided by the Military Airlift Command (MAC), the Military Sealift Command (MSC), and the Military Traffic Management Command

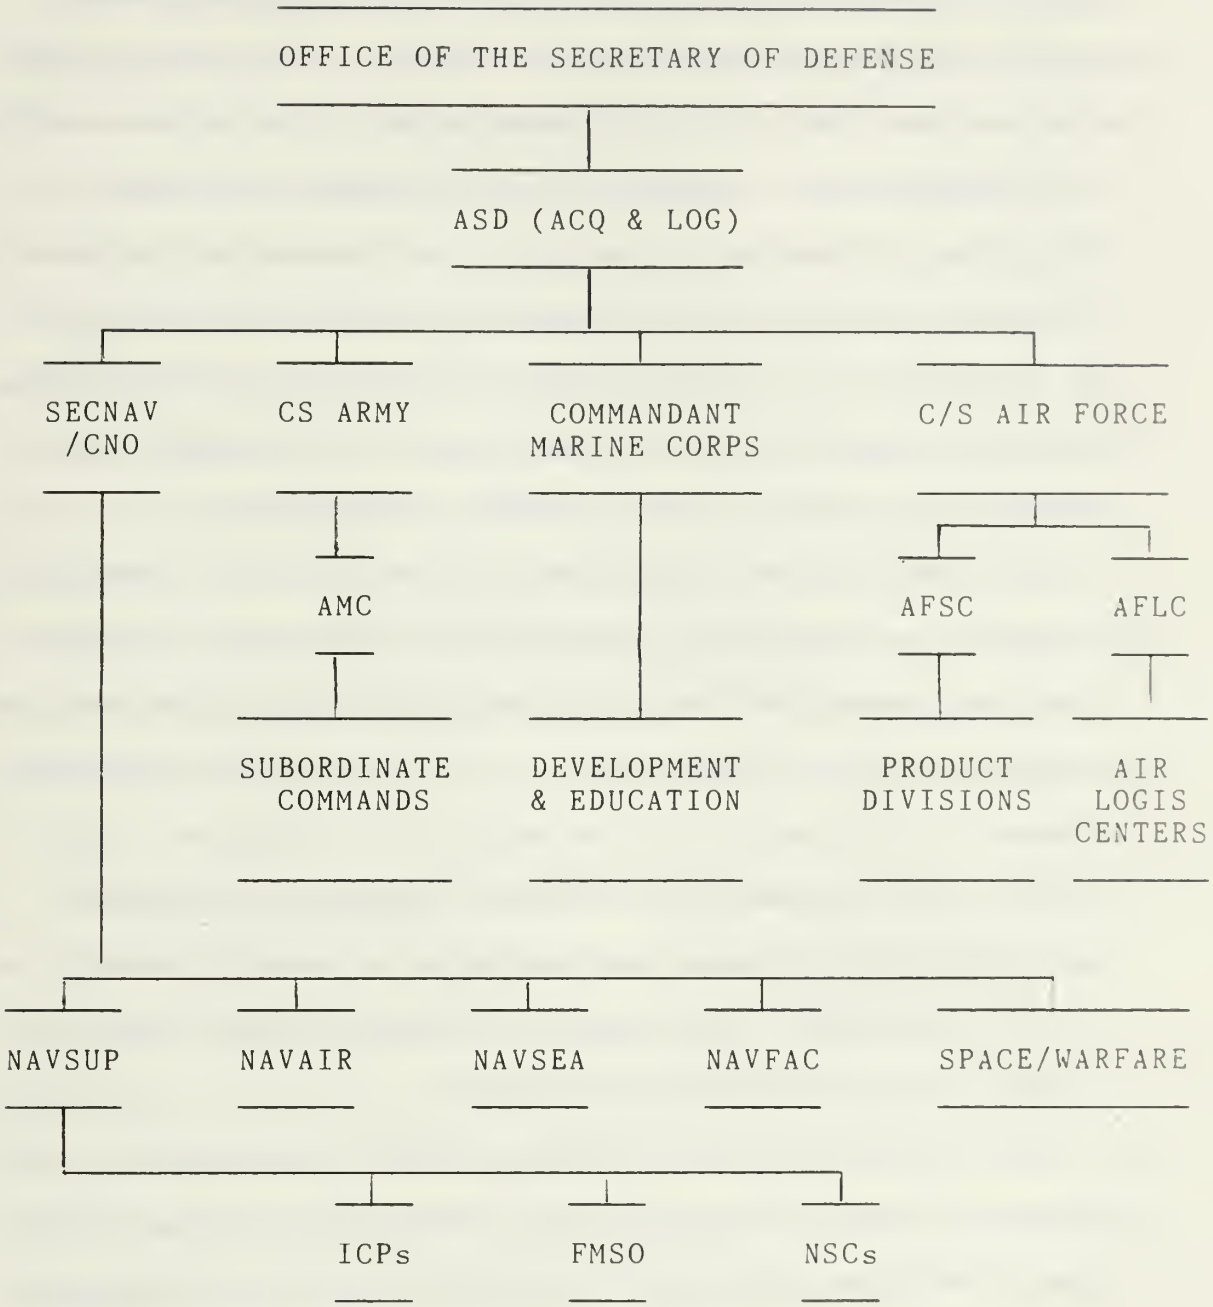

Figure II-1. Material Commands of the Services [2:17]

(MTMC). These Transportation Operating Agencies (TOAs) operate under the Departments of the Air Force, Navy, and Army, respectively. Each command acts as the single manager for the particular transportation provided and either purchases transportation service from commercial carriers or arranges shipment via DOD organic transportation systems. The three TOAs are collectively referred to as the Defense Transportation System (DTS) but there is no single agency or command which controls all of DOD transportation.

MTMC and MSC work together to move cargo from shippers to ultimate consignees for surface export shipments. MTMC clears and books surface cargo into the DTS and performs the necessary terminal operations and documentation for onward movement to the point of debarkation or consignee. MSC provides the framework for sealift capability through negotiation of container and shipping agreements with ocean carriers. The MSC also provides actual military sealift through the use of USNS vessels.

MAC is the principal transporter for air export shipments, with the Services and MTMC playing supporting roles. MAC provides airlift capability and operates aerial terminals necessary to move expedited cargo. MTMC supports air movements by acting as the interface between the shippers and the MAC terminal operator. MTMC also resolves packaging, documentation and other problems [3:10].

Although MTMC, MAC, and the Navy operate their own shipping terminals, aerial ports, and shipyards, the Navy and MTMC in particular rely extensively on counterpart resources in the private sector. New construction for the Navy is accomplished entirely in civilian yards, and the bulk of ocean cargo directed by MTMC passes through civilian piers and container terminals [4:5].

The DTS exists as a significant DOD transport system with its own air freight and passenger service (MAC), a shipping firm (MSC), and a container and rail service (MTMC). The resulting multi-service coordination required to operate this service could not be obtained without standardization of information systems.

C. THE DEFENSE LOGISTICS STANDARD SYSTEM

Standard logistics systems, programs, policy and administration within DOD for functional areas such as cataloging, inventory management, contracting, storage, supply support and transportation are collectively called the Defense Logistics Standard System (DLSS). These systems and policies are uniformly implemented at all levels within and between DOD components. The DLSS provides common data languages and procedures through standard forms, formats and codes to facilitate compatibility among users of defense logistics information. An in-depth discussion of all DLSS

programs is beyond the scope of this study. However, the principal aspects of four major systems are germane and are presented here to facilitate a better understanding of the discussion in later chapters. Figure II-2 illustrates the primary DLSS relationships discussed below.

1. MILSTRIP

Military Standard Requisitioning and Issue Procedures (MILSTRIP) require uniform documents, formats, codes, and time standards for the processing of logistics data. These data include material requisitioning, supply status, issue, receipt, and disposal codes. High-speed automated data processing is made possible through the MILSTRIP via DOD automated addressing and information network technology [5]. Figure II-3 is an example of a MILSTRIP material issue and receipt document.

2. MILSTAMP

Military Standard Transportation and Movement Procedures (MILSTAMP) draw data from MILSTRIP to move cargo into and through the DTS worldwide. MILSTAMP data elements, formats and priority policies are also fully standardized with the other MIL-systems. In order to accomplish this, MILSTAMP focuses on three areas: capacity planning, movement control, and performance measurement.

At each shipping activity, warehousing and transportation planning input is fed into a standard automated data processing system. These data are used

jointly by all military shipping activities to prepare processing documentation. Military movements are then planned and coordinated to prevent saturation of DTS capacity.

Processing documentation is also used for movement control. Summarized information provides a basis for air and surface shipment clearance authority as well as diversion decisions based on priority, weight or mode of shipment.

The effectiveness of cargo clearance, booking, terminal operations and documentation is dependent upon timely and accurate data. MTMC has administrative responsibility for MILSTAMP quality control. The MTMC "compliance program" stresses availability of MILSTAMP documents and data to DTS users for analysis and corrective action [1:155].

3. MILSTEP

A standard method for measuring MILSTRIP supply system performance and MILSTAMP transportation effectiveness is provided by the Military Supply and Transportation Evaluation Procedures (MILSTEP). MILSTEP traps pipeline performance and in-transit data for analysis and reporting to inventory control points, the Service secretaries, and the Secretary of Defense.

The Secretary of Defense assigned responsibility for the administration of MILSTEP to DLA and also created a MILSTEP Central Data Collection Point (CDCP). The CDCP

provides data processing support to DOD and Service/Agency Central Processing Points (CPP). The Air Force Logistics Command operates the CDCP, which collects, processes, and distributes in-transit data to each agency CPP [6:1].

The primary objective of MILSTEP is to measure supply and transportation performance against the time standards listed in the Uniform Material Movement and Issue Priority System (UMMIPS).

4. UMMIPS

The Uniform Material Movement and Issue Priority System (UMMIPS) prioritizes material requirements based on urgency of need and regulates cargo movement within the DTS. The UMMIPS helps satisfy the need to identify the relative importance of competing demands for logistics system resources such as transportation, warehousing, document processing, and material inventories. The system also establishes guidance for the ranking of material requirements and incremental time standards for requisition processing and material movement. Performance time frames are spelled out for the various priority designators; however, the times are dependent upon and assume the physical availability of the necessary resources [1:156].

The UMMIPS applies to all requisitioning, issue, and movement of material within DOD. The system is used to ensure that material is provided to users considering its

military importance, urgency of need, and other management considerations such as cost [7:1].

The UMMIPS ranks requisitions and movement actions by competing demand. A matrix combining the user's Force / Activity designator (FAD) and Urgency of Need Designator (UND) is used to derive a single Priority Designator (PD). Requisitioners code the PD onto a MILSTRIP document which is then given the appropriate issue, shipment and transportation handling by the DTS. Figure II-4 shows the relationship of the FAD and UND to the PD.

The Force/Activity Designator (FAD) is assigned by the Secretary of Defense, the Joint Chiefs of Staff, or by a DOD component and indicates the mission essentiality of the user. The lowest FAD required to indicate the relative importance of the unit is assigned. Figure II-5 is a brief outline of FAD definitions [7].

The Urgency of Need Designator (UND) is determined by the user based on UMMIPS criteria definitions. The Chief of Naval Operations tasks FAD assigners and the Navy systems commands with UMMIPS performance review related to the assignment of PDs by users. The vehicle for the review is an extensive reporting system which focuses on control of PD assignment abuse and does not consider logistics system timeliness. Figure II-6 gives some examples of UND criteria [7].

V - - - - - - -	08	10	15

Figure II-4. Derivation of Priority Designators [7]

performance of non-mechanized fleet units in comparison with RRTMIS performance reports.

The first test chosen for this comparison is the Analysis of Variance (ANOVA). The ANOVA F-test is deemed appropriate because of the large number of comparisons to be made. If many t-tests were used alternatively for each pair of means, the overall risk of rejecting the equality of means when all the means were in fact equal (Type I error) would be worse. The ANOVA method provides a single test for comparing all the means while controlling this overall risk [14:354].

In using the ANOVA procedure, the following assumptions were made:

- The RRTMIS and survey measurements are selected from a normal population.
- The RRTMIS and survey measurements are independent.
- The RRTMIS and survey group true variances are equal.

In making the above assumptions, certain potential problems exist. First, normality may be affected by heavy tails in the group population data if so indicated by outliers in the RRTMIS and sample data. If this is the case, the number of measurements is considered large enough in each group that the F probabilities will still be reasonably accurate.

Second, the equality of variances may be affected by the substantially different number of measurements in each group. The RRTMIS groups are much larger than the survey groups and

large variances could occur which may cause distortions in the F probabilities.

Should such distortions arise, Scheffe's method for assessing differences among specified means in terms of confidence intervals is considered a more conservative and general approach. Unless there is gross skewness or inequality of variances in the data, the robustness of Scheffe's method gives protection against even fairly serious violations of assumptions [14:367-370].

The approach to comparison of the RRTMIS and survey group means is therefore to use the ANOVA F-test first. After assessment of the results in light of the assumptions, Scheffe's method is then applied. The test results are summarized and presented in Chapter V.

V. ANALYSIS

A. HYPOTHESES

This chapter will seek to answer two principal questions about the RRTMIS and sample data. First, are the RRTMIS and sample group means equal? Equality of means would be a good indication that the RRTMIS data well describes the sample population. The alternative hypothesis is that the means are not equal. Significant differences among RRTMIS and sample means would tend to indicate that RRTMIS is not a good descriptor of the sample population.

Secondly, asking the question again but with a different method, are the differences between the RRTMIS and sample group means equal to zero? A possible alternative hypothesis here is that the sample group means are all significantly greater than the RRTMIS group means. This condition would tend to indicate longer transportation times for the non-mechanized fleet shipments than for those going to mechanized customers currently tracked by RRTMIS.

To answer these questions, the data were grouped by service, deployment status, mode of shipment, Naval Supply Centers and Depots, and combined overall performance. Each of the groups were further sorted by Issue Priority Group for computer analysis. The MINITAB and SPSS-x statistical programs were used to perform the Analysis of Variance,

Scheffe interval and normal confidence interval computations and to produce the graphic displays as the basis for the figures in this chapter [16:26].

Analysis in the following section is organized by data group. Accompanying histograms, boxplots, analysis of variance tables, Scheffe and normal intervals are referenced in the subsection for each group [17]. Pertinent RRTMIS statistics have been extracted from Appendix B to facilitate the discussion.

The histograms usually suggest skewness, indicating caution in application of the normality assumption is warranted. Sample sizes are considered to be sufficiently large to rely on the implications of the Central Limit Theorem for means when using the Analysis of Variance and confidence interval procedures [14:189-191]. Specifically, the service, Naval Supply Center and combined groups have no sample sizes less than 100. The deployment status group has one sample size of 97 and the remainder are over 100.

There is also some inequality of sample sizes between groups. This indicates a need for caution in interpretation of the Analysis of Variance results. The one questionable group is that for Issue Priority Group I air shipments, with a sample size of eight. However, the histogram of this group is mound shaped and symmetrical. In view of these compensating facts, the assumption of a normal population is

not considered crucial to the reliability of the test results.

B. ANALYSES

1. The Service Group

The Service group sorts the data by consignee. There are two consignee categories consisting of Pacific and Atlantic homeported ships. There were 665 Pacific and 620 Atlantic shipments in the sample. The RRTMIS sample sizes, means and standard deviations are shown in Figure V-1.

Histograms of the Transportation Time measurements are shown in Figures V-2-A through V-2-F. It should be noted that the histograms are not all on the same scale. A great deal of positive skewness is evident in the histograms.

The UMMIPS standards are three days for IPG I, six days for IPG II, and 13 days for IPG III shipments. For the Pacific, there were 24 IPG I shipments within the standard for 18.3% on time. This compares with 2.1% for the RRTMIS group. An on time summary is displayed with the histograms for each consignee. From the summaries it is evident that a greater proportion of the fleet sample shipments met the standard than from the RRTMIS groups.

Each data point was standardized by subtracting the appropriate appropritate RRTMIS group mean and dividing by the appropriate RRTMIS standard deviation from Figure V-1. Under the null hypothesis that the RRTMIS statistics describe

GROUP	SAMPLE SIZE	MEAN	STD DEVIATION

the sample data well, the distribution of the transformed data should have a mean of about zero and standard deviation one. For the discussion in this chapter, the transformed data will be called standard transformations even though the data will not look normal but highly skewed, as the histograms suggest.

Boxplots of the standard transformations for each group are shown in Figure V-3. These display a graphical summary of where the median is, how spread out the middle half of the scores are, and how the tails relate to it. The H-spread is the middle half of the data and whiskers show lower and upper quartiles of the values. An asterisk (*) represents a value outside the inner fence or range of the four quartiles (1.5 times the H-spread). A letter (O) represents a value far outside the fence (3 times the H-spread) [15:65-70].

The medians, indicated by a plus sign (+), for each of the Pacific IPG's appear to be identical, with a slightly lower H-spread for the IPG I scores. This would tend to indicate lower variances between the RRTMIS and sample means in the Pacific category. The Pacific IPG I plot has only three values outside the inner fence, while all the other groups have several outliers.

The Atlantic plots appear to have slightly more variability than the Pacific, but overall the spread appears very close among the groups. However, the large number of outlying values again indicate the skewness of the data. It

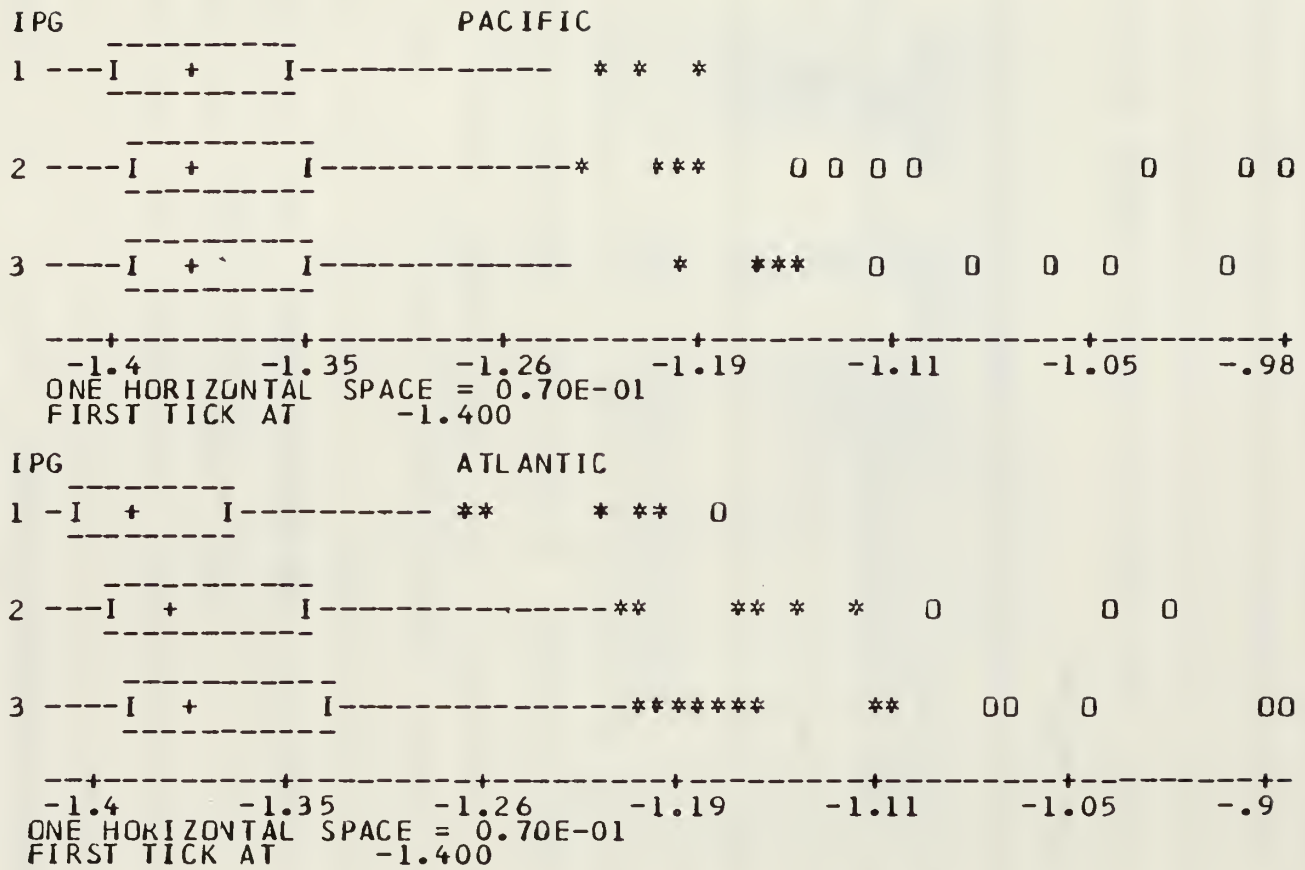

Figure V-3. Service Group Boxplots

is not surprising that the IPG II and IPG III shipments have more outlying values, since these groups typically experience large volume than IPG I.

The Analysis of Variance for the service group is presented in Figure V-4. The data used for the test are the standard transformations. If the RRTMIS data well describe the sample then all means would be zero. The test is for equal Issue Priority Group means among Pacific and Atlantic consignees, using a maximum probability of Type I error equal to .05. Since F = 11.57 is greater than 2.21, the F.05 value based on 5 and infinite degrees of freedom, the equality of means hypothesis is rejected. The attained significance level is less than .001 indicating strong rejection. Thus there is conclusive evidence of significant differences among the standard transformation means for the Issue Priority Groups.

The Scheffe multiple range test results in Figure V-5 reveal specifically which of these group means are different. The Scheffe table indicates that the Pacific IPG III average standard transformation is significantly different from (in fact greater than) that of the IPG I Atlantic group. The RRTMIS means describe the IPG III sample transportation times better than the other groups. This is encouraging since the UMMIPS standard for IPG III shipments is eight days greater than the IPG I standard and less variability in routine

Figure V-5. Service Group Scheffe and Normal Intervals

RRTMIS and sample shipments would be expected than in high priority ones.

The table also shows that the Atlantic IPG III mean standard transformation is significantly greater than all the other groups. This agrees with the ANOVA confidence interval graph in Figure V-4 and tends to indicate smaller differences between the RRTMIS and sample transportation times for routine shipments to Atlantic consignees. Comparatively, the paired Pacific groups were more different.

Figure V-5 also displays 99 percent normal confidence intervals for the means of the standardized data. None of the resulting normal confidence intervals contain zero, and all the range values are negative. Assuming the normality of the mean of the transformed data, there is 95% confidence that all six of the sample means are less than the corresponding RRTMIS means.

This condition would tend to indicate transportation times are shorter for non-mechanized Pacific and Atlantic consignees than for those going to RRTMIS customers. Whatever the delays and logistic obstacles experienced by the ships in the fleet sample, or possibly even because of the existence of these difficulties, they still received faster mean transportation service overall.

2. Deployment

The Deployment group sorts the data by ship operational status. There are two categories, not deployed and deployed. There were 647 shipments to not deployed and 638 shipments to deployed consignees in the sample. The RRTMIS sample sizes, means and standard deviations used in the standard transformations for this group are shown in Figure V-6.

Histograms of Deployment group Transportation Time measurements are shown in Figures V-7-A through V-7-F. The on time summary shows higher percentages of prompt shipments in every IPG of the sample than for the respective RRTMIS groups. It appears that the sample shipment performance far exceeded that of the RRTMIS customers in both deployed and not deployed status. Again, the histograms appear to be skewed to the right.

Data within each group were again standardized by subtracting the RRTMIS group mean and dividing by the RRTMIS standard deviation. Although the data will not be normally distributed, under the null hypothesis that the RRTMIS means and standard deviations well describe the sample data, the standardized data should have a mean of zero and a standard deviation of one.

Boxplots of the standard transformations for both of these categories by IPG are shown in Figure V-8. As in the Service group, the spreads appear very close with overlap

between ranges. This time the IPG I not deployed group has only two values outside the inner fence, while all the other groups have several values outside. All the boxes are close to the left side of the horizontal scale. These conditions tend to indicate negative standard transformations in all groups. The paired group data would be expected to be grossly similar.

Moving to the Analysis of Variance table in Figure V-9, it is evident that there must be at least one significantly different group. The test is for equal standardized IPG means among shipments to not deployed and deployed ships, using a .05 maximum probability of Type I error. Since the F-ratio of 13.29 is greater than the 2.21 critical value, the equality of means hypothesis is rejected. The attained significance level is less than .001, indicating strong rejection. So there is strong evidence that the mean standard transformation for at least one of the groups is significantly different than the others.

The Scheffe test bears this out. The table of range test results in Figure V-10 shows that the IPG III standard transformation average (-.6272) for not deployed consignees is significantly greater than all the other groups. This is supported graphically by the ANOVA confidence interval graph in Figure V-9. Smaller differences are indicated between the RRTMIS and sample transportation times for routine shipments to customers not deployed away from their home ports. By

Figure V-10. Deployment Group Scheffe and Normal Intervals

comparison, higher priority not deployed shipments and shipments to deployed customers experienced greater variability between the RRTMIS and sample times.

It should also be noted that there is some inequality of sample sizes among the groups, and that the medians of all the groups appear to be about the same. This suggests that the inequality of means indicated by ANOVA may be due to outlying values in the different groups since the data is skewed.

Turning to the hypothesis of all transformation means equal to zero, Figure V-10 also displays 99 percent normal confidence intervals for the mean of the transformed data. None of the normal confidence intervals for the paired Deployment group standard transformations contains zero, and all the values are negative. This indicates shorter mean transportation times for the sample customers than for the RRTMIS groups.

This is particularly interesting since the groups with the least difference between the RRTMIS and sample times were those for routine shipments to deployed customers. The smaller non-mechanized ships are apparently receiving slightly faster mean transportation service than any other customers.

3. Mode of Shipment

The Mode of Shipment group breaks the data down into air, surface, and local delivery transportation modes. There 572 air shipments, 210 surface shipments, and 503 local deliveries in the sample. The RRTMIS statistics used in the standard transformations for this group are presented in Figure V-11.

Transportation Time histograms by mode and IPG are shown in Figures V-12-A through V-12-I. Once again, the data appear to be right skewed. The histograms are on different scales in order to highlight the number of shipments on time against the UMMIPS standards. All of the sample air and local delivery groups exhibited higher on time performance against the UMMIPS standards than the RRTMIS groups. All of the sample surface shipment groups showed lower percentages of shipments on time than RRTMIS surface customers, although the IPG II's and III's were close. This could be due to the effect of short term local operation of ships away from their home ports while not deployed.

Ships in this status often remain out of port and away from onward forwarding of all deliveries for one to ten days. Surface shipments include parcel post originating from shippers other than the nearest stock point, and sixty-two percent of the surface sample was parcel post. Since the UMMIPS standard for IPG I Transportation Time is only three

days, it seems logical that the IPG I shipments would be the poorest performers.

The data were standardized as before by subtracting the appropriate RRTMIS group mean and dividing by the appropriate RRTMIS standard deviation. Under the null hypothesis that the RRTMIS statistics well describe the sample data, theh distribution of the transformations should have a mean of about zero and a standard deviation of approximately one.

The boxplots for the air and local delivery modes in Figure V-13 appear to have similar spreads with all the data clustered against the low end of the horizontal plot. Some caution must be used in looking at the boxplots since the scales are not always the same. Sample sizes also differ between groups.

The local delivery IPG I group has fewer values outside the fence than the air groups, indicating less variability between RRTMIS and the sample data for high priority shipments from the nearby stock point. The surface H-spreads are generally more to the right than those for the air and local delivery modes, which may indicate greater differences between the RRTMIS and sample surface groups, which has already been suggested by the on time summary from the histograms.

The Analysis of Variance for the Mode of Shipment group transformations is presented in Figure V-14, and

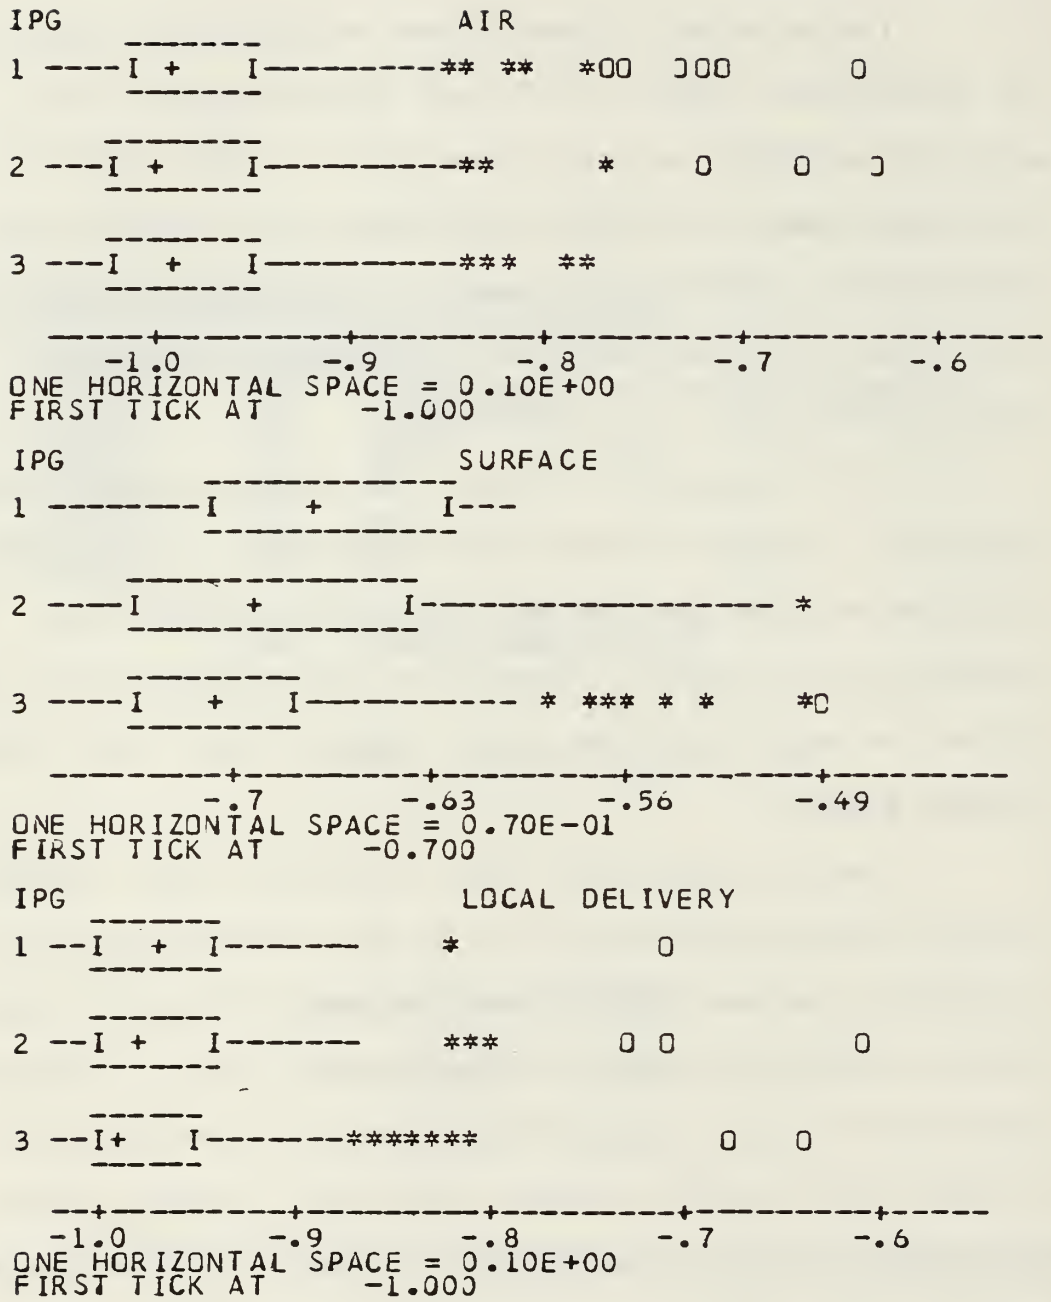

Figure V-13. Mode Group Boxplots

confirms the alternate hypothesis that at least one of the group means is different, although some caution is appropriate due to disparities in sample size. The F.05 value based on 8 and infinite degrees of freedom is 1.94. Since F = 8.74 is greater than the 1.94 critical value the equality of means null hypothesis is rejected. Strong rejection is indicated for this test by an attained level of significance of less than .001.

The Scheffe results in Figure V-15 delineate four group differences. The local delivery IPG II mean standard transformation is significantly less than the IPG III mean scores for all modes. This indicates comparatively less difference between the RRTMIS and sample IPG III mean local delivery times.

At first, this would appear to be the result of sheer volume. Of all the IPG III shipments, forty-seven percent were local delivery. Additionally, stock points administratively assign a transportation time of one day to all local delivery shipments, no matter what the actual time may be. This could have an effect of skewing the RRTMIS data to the low side.

On the other hand, this effect could not exist in the sample because actual receipt dates were used to compute the times. Since there is low variability in the differences between the RRTMIS and sample local IPG III means, the effect of the stock point policy is apparently minimal. The fact

Figure V-15. Mode of Shipment Scheffe and Normal Intervals

remains that mean transportation times for the RRTMIS and sample routine local delivery shipments were closer than for those with the higher priority.

A difference between the local delivery IPG III and the air IPG II means is also indicated, with the air shipments experiencing greater difference between the RRTMIS and samples means than the locals. This suggests that the routine local delivery shipments had a narrower range of values than the air shipments. This is just as reasonable to expect as with the local IPG II's because of volume processing of deliveries to local customers by stock points.

The results are also interesting in the absence of differences among the standardized IPG I means and any other groups. Issue Priority Group I performance between RRTMIS and the sample are not significantly different, even when the local operations situation is taken into account. This would tend to indicate that the higher priority shipments take about the same time for both groups.

The 99.7 percent normal confidence intervals for the standardized group means in Figure V-15 may amend this assessment slightly. Since none of the intervals contains zero, the null hypothesis of equality between all RRTMIS and sample group means is again rejected with 95 percent confidence. The fact that all the range values are negative shows that the sample mean transportation times for all modes are actually less than the RRTMIS time. However, there is a

significant difference between how much the sample group means differ from the RRTMIS means as indicated by the Analysis of Variance.

4. Naval Supply Centers and Depots

The Naval Supply Centers and Depots group (hereafter referred to as the NSC group) included only data on shipments made by one of the ten Naval Supply Centers or Depots listed in Figure IV-3. There were 1,018 NSC group shipments in the sample. The RRTMIS statistics for this group are shown in Figure V-16.

Figures V-17-A through V-17-C display histograms of the Transportation Time measurements. The sample on time performance exceeded that experienced by the RRTMIS customers in all three Issue Priority Groups. The histograms indicate gross similarity in the frequency distributions of all three groups. It should be noted, however, that the scales are different.

Once again, the data were standardized by subtracting the RRTMIS group mean and dividing by the RRTMIS standard deviation. Although the data will not be normally distributed, under the null hypothesis that the RRTMIS means and standard deviations well describe the sample data, the transformed data should have mean zero and standard deviation one.

Boxplots in Figure V-18 indicate similar medians for the standard transformations of the three Issue Priority

Groups. The H-spreads are all close to the low end of the horizontal plot, with numerous values outside and far outside the inner fence in all three groups, again indicating skewness. The IPG III scores appear a little more closely grouped, indicating smaller differences between the RRTMIS and sample means, but overall the spread appears very close among the groups.

The closer grouping of the IPG III scores is also evident in the Analysis of Variance data in Figure V-19. The ANOVA confidence interval graph shows the IPG III interval standing alone at the right side of the scale. The graph strongly suggests that this group's mean will be different from the others. The null hypothesis of equal means is strongly rejected, since F = 16.35 is greater than the 3.00 critical value at .05 maximum probability of Type I error with two and infinite degrees of freedom. The attained significance level is much less than .001.

The results of Scheffe's test shown in Figure V-20 confirm that the IPG III standard transformation mean is significantly greater than those of the other groups. This indicates sharply smaller differences among the RRTMIS and sample mean transportation times for IPG III shipments from Naval Supply Centers and Depots. This demonstrates significant evidence that the UMMIPS priority system is working.

Figure V-20. NSC/D Group Scheffe and Normal Intervals

No significant difference among the IPG group means regardless of alignment between RRTMIS and the sample would tend to indicate ineffective management of shipments in support of the mission criticality and urgency of need criteria discussed in Chapter II. This evidence also suggests that transportation time performance is similar from the NSC group for routine shipments measured by RRTMIS and the sample.

It is obvious from the 99 percent normal confidence intervals for the transformed means that none contain zero, confirming rejection of the equality of means. Again, all the range values are negative, indicating lower mean transportation times for the sample than for the RRTMIS customers, regardless of NSC group priority.

5. Overall Issue Priority Groups

The Overall group sorts the data by Issue Priority Group across all categories. There were 293 IPG I, 397 IPG II and 402 IPG III shipments in the sample. The RRTMIS sample sizes, means and standard deviations used in the standard transformations for this group are provided in Figure V-21.

Histograms of the Transportation Time measurements are shown in Figures V-22-A through V-22-C. It should be noted that the scales are different. The sample on time performance exceeded that experienced by RRTMIS customers in all three priority groups. The IPG II histogram exhibits a

longer tail of outliers than the other two groups, indicating greater potential variability in the data for that group.

Each data point was standardized by subtacting the appropriate RRTMIS group mean and dividing by the respective RRTMIS standard deviation. Under the null hypothesis that the RRTMIS statistics well describe the sample data, the distribution of the transformed data should have a mean of about zero and a standard deviation of about one.

This observation is consistent with the standard transformation boxplots shown in Figure V-23. The IPG II box has a greater number of values far outside the inner fence than either of the other groups. The H-spreads are grouped close to the lower end of the horizontal plot, indicating the majority of the data values are comparatively close together with relatively small differences between the RRTMIS and sample groups.

The evidence presented in the Analysis of Variance in Figure V-24 supports rejection of the equality of means null hypothesis for the Overall group. The F-ratio of 36.30 is significantly greater than the 3.0 critical value and the attained level of significance is less than .001, indicating strong rejection.

Scheffe's test shown in Figure V-25 reveals the specific differences among the group means. The IPG III mean is significantly different from both of the other group means and exhibits the lowest variability between RRTMIS and the

Figure V-25. Overall Group Scheffe and Normal Intervals

sample of the three priority groups. As previously discussed, this would normally be expected since routine shipments receive steady workloading at the major stock points, and account for the majority of shipments.

Scheffe's table also shows significant difference exists between the IPG I and IPG II means. Specifically, the IPG II means differ more from the RRTMIS mean than the others. This could be due to the mix of shipment modes by priority group. IPG I shipments in the sample were 76% air, IPG II shipments were 46% air, while IPG III shipments were only 25% air. This suggests that a more even mix of air shipments against the other modes may be related to variability between the RRTMIS and sample data, especially since the RRTMIS IPG/mode relationships are similar.

The 99 percent normal confidence intervals for the means of the standardized data in Figure V-25 once again do not contain zero, indicating that the null hypothesis of equal sample and RRTMIS group means should be rejected. Consistently, all the range values are negative. This further supports the conclusion that the ships in the sample experienced faster mean transportation times than RRTMIS customers, regardless of overall Issue Priority Group.

VI. CONCLUSIONS

A. CONCLUSIONS

Significant differences among the RRTMIS and fleet sample Issue Priority Group means exist in the service, deployment, mode of shipment, stock point, and overall data groups. In general, the RRTMIS statistics do not well describe the fleet sample data. Longer mean transportation times were experienced by mechanized customers currently tracked by RRTMIS than by non-mechanized ships in the fleet sample. Specific differences for each data group indicated by the analytical test results are presented below.

Within the Service group, the RRTMIS mean and standard deviation best describe the fleet sample data for Atlantic IPG III shipments. The Atlantic IPG I group exhibited greater differences between the sample data and the RRTMIS statistics than any of the other groups. The normal confidence intervals demonstrated shorter mean transportation times for the fleet sample than for the RRTMIS customers in both oceans and all shipment priorities. These facts suggest that IPG I shipments to the Atlantic fleet sample customers had the fastest mean transportation times in this group.

Within the Deployment group, IPG III shipment data for non-deployed customers in the fleet sample were best described by the RRTMIS statistics. The non-deployed IPG I

group showed the greatest differences between RRTMIS and the sample. While all the groups indicated shorter mean transportation times for the sample than for RRTMIS, IPG I shipments to the non-deployed sample customers were the fastest.

Within modes of shipment, IPG II local delivery data for fleet sample customers were significantly shorter than the mean transportation times for IPG III shipments by any mode. There was also a significant difference between IPG II air and IPG III local delivery mean transportation times. Once again, the normal confidence intervals demonstrated shorter mean transportation times for the fleet sample than for the RRTMIS customers for all modes and priority groups. Because of large differences in group sample sizes, the relative description of fleet sample data by the RRTMIS statistics for the mode of shipment group was inconclusive.

Within the Naval Supply Center and Depots group, it was clear that the RRTMIS mean and standard deviation best described the fleet sample transportation times for IPG III shipments. This suggests that the RRTMIS and fleet sample transportation time performance is most similar for IPG III issues from Naval Supply Centers and Depots. The IPG II data exhibited the greatest differences between RRTMIS and the sample. All priorities indicated shorter mean transportation times for the fleet sample than for RRTMIS. Mean

transportation time from NSCs to IPG II fleet sample customers was the fastest for this group.

Overall, the RRTMIS statistics best describe fleet sample data for IPG III shipments. The same conclusion can be made for Service, Deployment, and Naval Supply Center Groups above. Again, all Issue Priority Groups exhibited shorter mean transportation times for the fleet sample than for RRTMIS. The greatest difference between the sample data and the RRTMIS mean and standard deviation is for IPG II shipments. This indicates significantly faster mean transportation times for IPG II shipments to the ships in the fleet sample than for any other priority.

This study has shown that non-mechanized requisition, shipment and receipt data can be collected, analyzed and reported through statistical sampling techniques. It has been further shown that the RRTMIS statistics generally do not describe such a sample well, and that the non-mechanized fleet mean transportation times tend to be faster than those for shipments to RRTMIS customers. Ships in the fleet sample also had a higher percentage of shipments on time relative to the UMMIPS time standards, except for surface modes of shipment where large differences in sample sizes made the percentage comparisons inconclusive.

B. AREAS FOR FURTHER RESEARCH

Other issues related to this study should be pursued in order to fully understand the causes of these findings. Some comparison of Transportation Time to the Total Requisition Time for the sample measurements should be made to determine if the sample ships receive faster Mean Supply Response Time than RRTMIS customers. Further cross-tabulation analysis of the service, deployment, mode, ship type, Transportation Time, and Total Requisition Time variables may reveal significant interdependencies which would suggest certain causes of these relationships. The data in Appendices B and D are sufficient to support such analyses.

MECHANICSBURG, PA  17055          ********************************************************************************

PURPOSE OF RRTMIS II REPORTING SYSTEM    THIS COMPREHENSIVE STATISTICAL ANALYSIS OF THE NAVAL SUPPLY SYSTEM RESPONSE TIME SEGMENTS
                                         PROVIDES A HIGHLY EFFECTIVE MEANS OF APPRAISING PERFORMANCE, EXPOSING INEFFICIENCIES AND
                                         WEAKNESSES, AND PRESCRIBING REMEDIES.

DISTRIBUTION OF RRTMIS II REPORTS:       DETAILED AND SUMMARY LEVEL REPORTS ARE PRODUCED QUARTERLY AND ANNUALLY FOR DISTRIBUTION TO MANY
                                         USERS INCLUDING NAVSUP, NAVMTO, ASO, SPCC, APPROPRIATE TYPE COMMANDERS, STOCK POINTS, AND OTHERS
                                         UPON REQUEST.  (SEVERAL REPORTS MAY ALSO BE PRODUCED FOR A SPECIFIED MONTH OR MONTHS.)

RRTMIS II REPORTING SYSTEM DESIGN:       THIS SYSTEM IS HIGHLY USER-ORIENTED, AS A LARGE DEGREE OF FLEXIBILITY HAS BEEN INCORPORATED INTO
                                         THE UNDERLYING DESIGN.  THE USER MAY REQUEST REPORTS TAILORED TO HIS SPECIFIC REQUIREMENTS BY
                                         SELECTING AVAILABLE REPORT OPTIONS.

INDEX OF RRTMIS II REPORTS    (1)  SUBMISSION TIME REPORT                    (SUBM) (9) AVERAGE CUSTOMER WAITING TIME REPORT --
   (RRTMIS IDS ARE            (2)  REFERRAL PROCESSING TIME REPORT           (RPTR)      (ACWR) OR (ACWM)
   IN PARENTHESES)            (3)  NAVY STOCK POINT PROCESSING TIME REPORT   (SPPT)
                              (4)  DEFENSE DEPOT PROCESSING TIME REPORT      (DDPT)
                              (5)  TRANSPORTATION HOLD TIME REPORT           (HOLD)
                              (6A) TRANSPORTATION TIME REPORT -- FOR AREAS   (TRNA OR REOA)
                              (6B) TRANSPORTATION TIME REPORT -- FOR FLEETS  (TRNB OR REOB)
                              (6C) TRANSPORTATION TIME REPORT -- FOR CONSIGNEES (TRNC OR REOC)
                              (7)  TOTAL REQUISITION RESPONSE TIME REPORT    (TRRT)
                              (8)  RECEIPT TAKE-UP TIME REPORT               (RTUT)

SPECIAL REQUESTS REQUIRE THAT    (A) NAME OF DESIRED REPORT (OR TIME SEGMENT UNDER CONSIDERATION)
THE USER FURNISH THESE SPECIFICS:(B) THE PARTICULAR QUARTER, YEAR, OR MONTH (IN SOME CASES) FOR WHICH DATA IS TO BE DISPLAYED
                                 (C) THE VARIABLES AND DESIRED HIERARCHY, OR ORDER OF CONSIDERATION, OF THE VARIABLES CHOSEN
                                 (D) A LISTING OF THOSE NUMBERS CORRESPONDING TO CATEGORIES DESIRED FOR PRINTING OF EACH VARIABLE

LISTING OF VARIABLES CONSIDERED  (#1)   ISSUING STOCK POINT          (ISSUE SIK PT)

```

INPUT FILE RRTMIS
PERIODICITY: QUARTERLY
TIME PERIOD: OCT 1984 - DEC 1984

REPORT TITLE:
TRANSPORTATION TIME REPORT -- FOR FLEETS

TIME PERIOD COVERED IN THIS REPORT: FROM THE DATE THE MATERIAL IS SHIPPED UNTIL THE DATE IT IS RECEIVED
(SEE DOUBLE-DASHED SEGMENT BELOW)

REQUISITION RESPONSE
TIME SEGMENTS (OVERALL)

DOCUMENT DATE	DATE RECEIVED AT PT OF ENTRY	DATE RECEIVED AT ISSUE STK PT	SUPPLY ACTION DATE	DATE OFFERED FOR SHIPMENT	DATE MATERIAL IS SHIPPED	DATE MATERIAL IS RECEIVED

THE FOLLOWING RECORDS
WERE EXCLUDED FROM ANALYSIS REQUISITIONS WITH TRANSPORTATION TIMES EXCEEDING 99 DAYS

THE FOLLOWING VARIABLES ARE USUALLY CONSIDERED (IN THIS HIERARCHICAL ORDER) FOR THE PRINTING OF THIS REPORT:	CORRESPONDING SUPPRESSION LEVELS:
(#1) ISSUING STOCK POINT	250
(#6B) FLEET	100
(#3) TRANSPORTATION MODE	50
(#4) ISSUE PRIORITY GROUP	30

THE FOLLOWING VARIABLES WERE EXPLICITLY CHOSEN (IN THIS HIERARCHIAL ORDER) FOR THE PRINTING OF THIS REPORT:	CHOSEN SUPPRESSION LEVELS
(#6B) FLEET	
(#6C) CONSIGNEE	
(#1) ISSUING STOCK POINT	
(#3) TRANSPORTATION MODE	
(#4) ISSUE PRIORITY GROUP	

NOTE CONCERNING SUPPRESSION LEVELS. THE SUPPRESSION LEVELS USED PROVIDE A MEANS OF CONTROLLING REPORT VOLUME AND SIGNIFICANCE NOTICE THAT THE SUPPRESSION LEVELS GIVEN ABOVE ARE IN DESCENDING ORDER, SINCE THEY CORRESPOND TO THE PRINT HIERARCHY. SUPPOSE THE NUMBER OF REQUISITIONS FOR IPG= III CASREP WAS NOT AT LEAST 0 FOR A PARTICULAR CATEGORY, SAY TRANS MODE= LOCAL DELIVERY THIS PRINTING WOULD THEN BE SUPPRESSED; HOWEVER, THE DATA DISPLAYED FOR THE TRANS MODE= LOCAL DELIVERY WOULD INCLUDE IPG= III CASREP IN THE COMPUTED STATISTICS

CROSS REFERENCE INDEX THE FINAL PAGES OF THE PRINTED REPORT PROVIDE AN EASY TO USE CROSS-REFERENCE INDEX FOR THE PURPOSE OF QUICKLY LOCATING SPECIFIC DATA SUPPRESSED PAGES WILL BE ABSENT FROM THIS LISTING.

PRINT CATEGORIES. THE FOLLOWING PAGES PROVIDE A COMPLETE LISTING OF ALL PRINT CATEGORIES FOR EACH OF THE TWELVE BASIC VARIABLES CONSIDERED IN THE RRTMIS II REPORTING SYSTEM THOSE CATEGORIES WITH A DOUBLE ASTERISK (**) HAVE SPECIFICALLY BEEN REQUESTED BY THE USER. IN THE ABSENCE OF A SPECIFIC USER-REQUESTED LIST, A SET OF DEFAULT PRINT CATEGORIES WILL BE USED THESE WILL BE NOTED ON THE LISTING BY A SINGLE ASTERISK (*)

NOTE - ANY OF THE TWELVE VARIABLES AND CORRESPONDING CATEGORIES MAY BE SELECTED

THE FOLLOWING VARIABLES ARE CONSIDERED AS PAGE-IDENTIFYING VARIABLES
(#6B) FLEET
(#6C) CONSIGNEE

THE FOLLOWING VARIABLES ARE CONSIDERED WITHIN A PAGE:
(#1) ISSUING STOCK POINT
(#3) TRANSPORTATION MODE
(#4) ISSUE PRIORITY GROUP

THE CODES IDENTIFY THE PRINT CATEGORIES, BY NUMBER, FOR EACH OF THE ABOVE PAGE-IDENTIFYING VARIABLES

NOTE: A MAXIMUM OF THREE VARIABLES CAN BE CONSIDERED WITHIN A PAGE.

A MAXIMUM OF FOUR VARIABLES CAN BE CONSIDERED AS PAGE IDENTIFYING VARIABLES.

NOTE: AN ASTERISK BELOW DENOTES THAT AT LEAST ONE SIGNIFICANT CHANGE IS ON THE PAGE.
